Table des matières

CLeaner des paths FAILED

```
scsimgr lun_map | grep disk | awk '{print $7}' > /tmp/disk.txt
for i in `cat /tmp/disk.txt`; do scsimgr -p lun_map -D $i | grep FAILED | cut -d: -f3 | xargs -i -t rmsf -H {} ; done
vxdctl enable
```

Lister les cartes fibres

```
root@parc2899:/$ ioscan -fnkCfc
Class     I  H/W Path        Driver   S/W State   H/W Type     Description
============================================================================
fc  0  1/0/10/1/0/4/0  fcd      CLAIMED INTERFACE    HP A9784-60002 PCI/PCI-X Fibre Channel
                           /dev/fcd0
fc  1  1/0/11/1/0/4/0  fcd      CLAIMED INTERFACE    HP A9784-60002 PCI/PCI-X Fibre Channel
                           /dev/fcd1
```

Afficher les infos

On utilise la commande *fcmsutil* avec le nom du device en paramètre (cf. ci-dessus).

```
/opt/fcms/bin/fcmsutil /dev/fcd0
```

On peut voir d'autres infos avec :

```
/opt/fcms/bin/fcmsutil /dev/fcd0 vpd
```

N_Port Port World Wide Name

PowerPath & PVlink

Le nombre d'alternate PV est effectivement différent selon les VG. Ils sont utilisés lorsque PVlink est en charge du failover. Dans le cas de PowerPath, ils n'ont pas d'utilité car le driver PowerPath agit à une couche inférieur du LVM HP-UX. Quelquesoit le chemin utilisé par LVM, PowerPath redirigera les I/Os vers le chemin actif du disque. En clair, la définition d'alternate PV dans LVM n'est pas utilisé dans la gestion du failover par PowerPath.

Divers

```
ioscan -fuNC disk
ioscan -fnClunpath
scsimgr lun_map
```

scsimgr

- Serial number

```
[root@ivm15 - /var/adm/syslog ] # scsimgr get_attr -D /dev/rdisk/disk640 -a wwid -a serial_number
